

# Distilling Large Vision-Language Model with Out-of-Distribution Generalizability

Xuanlin Li\*, Yunhao Fang\*, Minghua Liu, Zhan Ling, Zhuowen Tu, Hao Su University of California San Diego

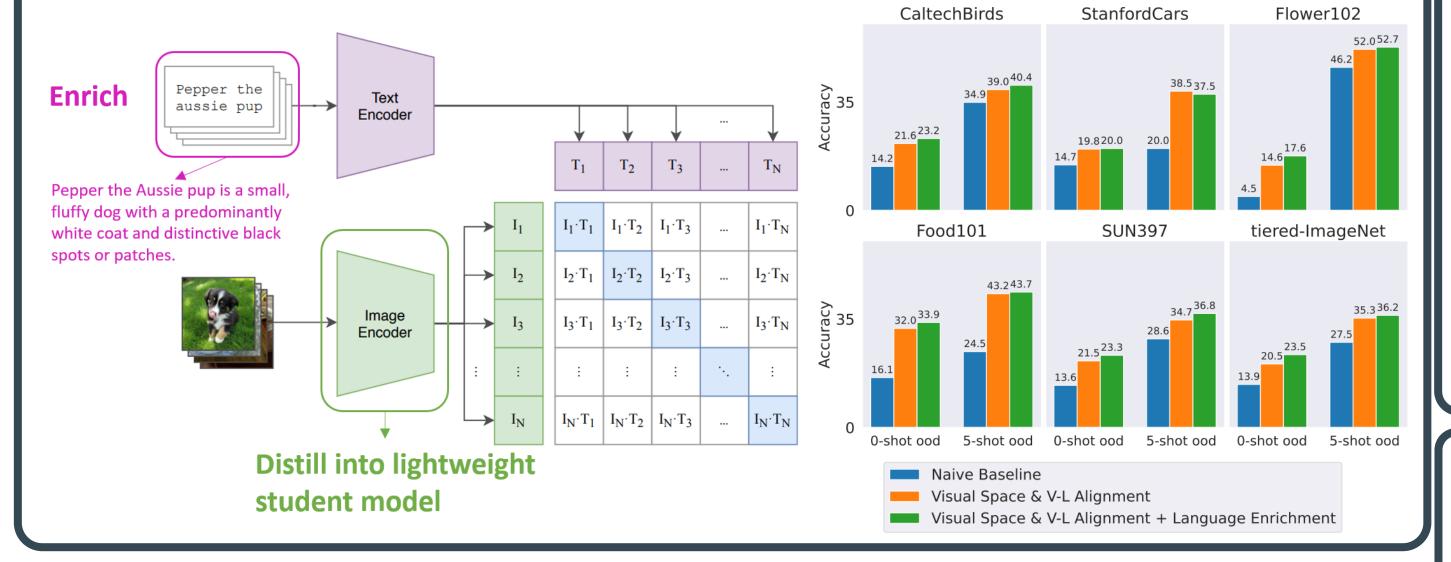

Search Paper Link

#### Overview

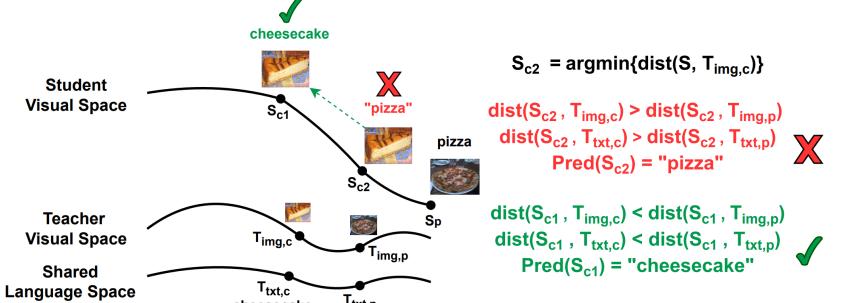

- Goal: Distill visual representations in large vision-language teachers into lightweight student models, while allowing students to possess strong open-vocabulary generalization ability towards out-of-distribution (OOD) concepts.
  - Potential for deployment on mobile / IoT devices and robotics scenarios.
- Experiments are conducted on small-to-medium datasets, allowing for fast research & development (R&D) cycles and is practical for lower-data regimes like 3D and robotics.
- Main Findings: 2 principles to enhance student's OOD generalizability:
- Better imitate teacher's visual representation space, and carefully promote better vision-language alignment coherence with the teacher.
- Enrich teacher's language representations with more finegrained & meaningful attributes to effectively distinguish between different labels, both during distillation and inference. This can be accomplished by prompting LLMs like ChatGPT.

## **Teacher-Student Visual Space Alignments**

- Precisely matching teacher and student's highdimensional visual spaces is inherently challenging (with high MSE feature matching loss).
- In this case, minimizing student-teacher visual feature distance does NOT yield the best OOD generalization ability for students.

cheesecake

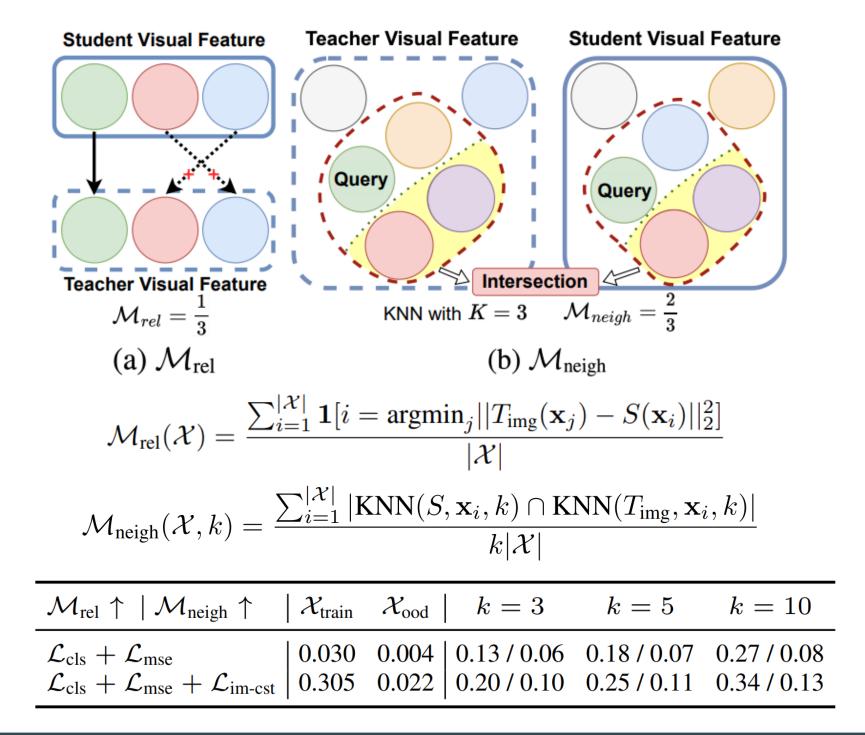

$\mathcal{L}_{ ext{cls}}(\mathbf{x},y) = \sum_{y'} -1_{y'=y}$	$\log P_S(y' \mathbf{x})$	
$P_S(y \mathbf{x}) = \frac{\exp(\cos t)}{\sum_{y' \in \mathcal{Y}} \exp(t)}$	$\frac{\mathrm{s}(S(\mathbf{x}), T_{txt}(l))}{\mathrm{cos}(S(\mathbf{x}), T_{tx})}$	$(y))/ au) \ { m t}(l(y'))/ au)$
$\mathcal{L}_{ ext{mse}}(\mathbf{x}) =   S(\mathbf{x})  $	$(\mathbf{x}) - T_{\text{img}}(\mathbf{x})$	$  _{2}^{2}$
$\mathcal{L}_{\text{im-cst}}(\mathbf{x}) = \frac{\exp(- \mathbf{x} )}{\sum_{\mathbf{x}'} \exp(- \mathbf{x} )}$	$\frac{ S(\mathbf{x}) - T_{\text{img}} }{- S(\mathbf{x}) - T_{\text{i}} }$	$\frac{ \mathbf{x})  _2^2/ au}{ \mathbf{x}  _2^2/ au }$
		SUN397

	Food101	SUN397
$\mathcal{L}_{ ext{mse}}$	0.24 / 28.4°	0.36 / 34.9°
$\mathcal{L}_{\text{mse}}$ (RN50)	0.24 / 28.4°	$0.35 / 34.4^{\circ}$
$\mathcal{L}_{ ext{cls}} + \mathcal{L}_{ ext{mse}}$	0.45 / 39.2°	$0.71  /  49.8^{\circ}$
$\mathcal{L}_{cls} + \mathcal{L}_{mse} + \mathcal{L}_{im\text{-}cst}$	0.65 / 47.6°	$0.82$ / $53.8^\circ$
$\mathcal{L}_{ ext{cls}} + \mathcal{L}_{ ext{im-cst}}$	1.29 / 69.2°	1.28 / 68.9°

Average MSE / degree difference between student & teacher visual features for students trained with different strategies. Student: RN18; Teacher: CLIP ViT-L/14

- However, teacher-student coherence in **local visual space structures** and **relative visual feature relationships** is crucial for student OOD generalization, as they *implicitly* enhance vision-language alignments.
- We find that Contrastive losses like  $L_{im-cst}$  are especially helpful for student OOD generalization, as it enables much better student-teacher proximity in both local and relative visual feature structures.

#### Teacher-Student Vision-Language Alignments

- Explicitly enhance teacher-student vision-language alignment coherency.
- Carefully preserve teacher's vision-language alignment structure by accounting for teacher misalignments (through e.g.,  $L_{vlprox}$ ).

$$\mathcal{L}_{\text{vlprox}}(\mathbf{x}, k) = I(\mathbf{x}) \cdot \mathcal{D}_{\text{KL}}(P_{T, \text{topk}}(\cdot | \mathbf{x}) || P_{S, \text{topk}}(\cdot | \mathbf{x}))$$

$$I(\mathbf{x}) = \mathbf{1}[\operatorname{argmax}_{y} P_{T}(y | \mathbf{x}) = \operatorname{label}(\mathbf{x})]$$

$$P_{\cdot, \text{topk}}(y | \mathbf{x}) = \frac{\mathbf{1}_{y \in Y_{\text{topk}}} P_{\cdot}(y | \mathbf{x})}{\sum_{y \in Y_{\text{topk}}} P_{\cdot}(y | \mathbf{x})}; Y_{\text{topk}} = \operatorname{argtopk}_{y} P_{T}(y | \mathbf{x})$$

$\mathcal{M}_{ ext{vlalign}}\downarrow$	k=2	k = 3	k = 5
$\mathcal{L}_{ ext{cls}} + \mathcal{L}_{ ext{mse}}$	0.20 / 0.50	0.68 / 1.45	2.67 / 4.73
$\mathcal{L}_{ ext{cls}} + \mathcal{L}_{ ext{mse}} + \mathcal{L}_{ ext{im-cst}}$	0.18 / 0.43	0.62 / 1.3	2.52 / 4.24
$ \begin{split} \mathcal{L}_{cls} + \mathcal{L}_{mse} \\ \mathcal{L}_{cls} + \mathcal{L}_{mse} + \mathcal{L}_{im\text{-}cst} \\ \mathcal{L}_{cls} + \mathcal{L}_{mse} + \mathcal{L}_{im\text{-}cst} + \mathcal{L}_{vlprox} \end{split} $	0.17 / 0.39	0.59 / 1.17	2.17 / 4.20

$$\mathcal{M}_{\text{vlalign}}(\mathcal{X}, k) = \frac{\sum_{i=1}^{|\mathcal{X}|} \text{\#reverse\_pairs}(\text{arrS}(i, k))}{|\mathcal{X}|}$$

$$\text{arrS}(i, k) = [||S(\mathbf{x}_i) - T_{\text{txt}}(l(y_j))||_2]_{j \in \mathcal{I}(i, k)}$$

$$\mathcal{I}(i, k) = \text{argtopk}([-||T_{\text{im}}(\mathbf{x}_i) - T_{\text{txt}}(l(y_j))||_2)]_{i=1}^{|\mathcal{Y}|})$$

### Language Representation Enrichment

- Prompt ChatGPT to enrich label descriptions: "Use a single sentence to describe the appearance and shape of {cls}. Only describe the shape and appearance."
- ChatGPT-enriched descriptions are significantly more informative than e.g., auxiliary captions generated by OFA, supplying comprehensive details to distinguish finegrained categories.

Original Description:

"A photo of an Acura Integra Type R 2001" ChatGPT-Enriched:

"A photo of an Acura Integra Type R 2001.
The 2001 Acura Integra Type R features a compact and sporty design with a sleek, aerodynamic body, sharp angles, and a distinctive rear spoiler."

Auxiliary Caption from OFA:

"A white car is parked in a field."

 ChatGPT-enriched language representation space confers more independent & meaningful attributes to distinguish labels, allowing
 OOD text features to be more precisely aligned with image features.

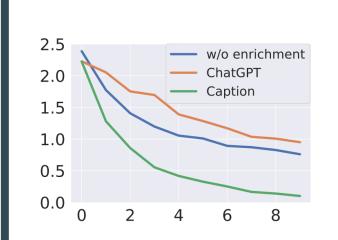

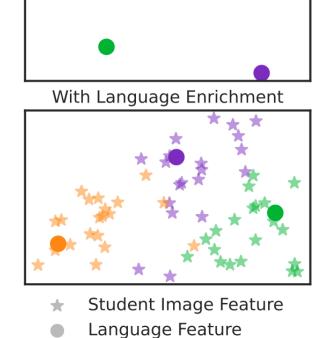

Figure 4: Top 10 eigenvalu
of text features.

	Cos. Sim.
w/o enrichment	0.5156
ChatGPT	0.4462
Caption	0.5572
